Community Governance Training and Participation Pilot

A three-week initiative to help members understand proposals, inspect evidence and participate safely in DAO voting.

Reference	CG-DEMO-2026-02 / version 1.0
DAO ID	cyber-demo-dao
Proposal title	Community Governance Training and Participation Pilot
Type / duration	STANDARD / 21 days after kickoff
Decision requested	Approve the proposed EUR 4,500 training pilot.

1. Purpose and proposed activities

Improve members' understanding of DAO proposals, evidence and wallet-based voting through two guided workshops and an accessible participation guide. The planned attendance target is 30 participants across the pilot; this is a target, not a recorded member or voter count.

Workshop 1 covers proposal purpose, supporting PDFs, source citations and differences between proposed commitments and completed work. Workshop 2 covers connected-wallet use, voting eligibility, transaction confirmation and comparison of database records with blockchain observations.

2. Proposed budget

Allocation	Amount
Workshop preparation and facilitation	EUR 2,000
Training guides and learning materials	EUR 1,500
Accessibility and participant support	EUR 750
Contingency	EUR 250
Total proposed budget	EUR 4,500

Contingency is reserved for unexpected delivery costs. No provider has been appointed, no payment recipient is specified and no funds have been disbursed under this demonstration proposal.

3. Delivery milestones

Day 1 is the kickoff after approval and confirmation of a delivery owner. These milestones are separate from the voting dates configured in the DAO interface.

Deadline	Deliverable
Day 7	Publish an accessible draft guide and the workshop plan.
Day 14	Complete two workshops and collect voluntary participant feedback.
Day 21	Publish the final guide and a report summarizing attendance, feedback and unresolved issues.

4. Success criteria

Deliver two workshops and a final participation guide. Record actual attendance against the planned target of 30 participants. Include at least five worked examples covering proposal interpretation, PDF citations, wallet safety, vote confirmation and database-to-chain comparison. Report feedback without claiming a predetermined improvement score.

5. Risks and mitigations

Risk	Planned mitigation
Low attendance	Share invitations early and offer a recorded walkthrough.
Wallet or transaction confusion	Use test wallets and guided examples; never request private keys or recovery phrases.
Misunderstanding AI answers	Show source excerpts and explain that citations require inspection.
RPC or network interruption	Use saved examples clearly labeled with their observation time.
Personal information in feedback	Collect only necessary information and publish aggregated findings.

6. Governance and evidence boundaries

Voting options are Approve, Reject and Abstain. Actual member assignments, voting dates, vote totals and final outcome must come from the application and contract after proposal creation. This PDF does not specify a quorum percentage, an on-chain proposal ID, a contract address or transaction hashes.

This is synthetic data for a live software demonstration. The document describes proposed activities and targets; it does not prove that workshops occurred, 30 people attended or the budget was approved. Approval does not automatically release funds or execute contract changes. No password or API credentials are provided.
